

LU10.S01 - Hello World

Code solution

HelloWorld.js as ZIP

Assignments

As always, our first program on the server is a small script designed to greet the world with the infamous “Hello World”.

1. Open your Webstorm editor and establish a JavaScriptfile. Name ist *helloWorld.js*. The file extension is assigned automatically.
2. Write in this script your helloWorld statement, using the JS command *console.log()*. Save your file.
3. Generate more terminal outputs by using arrays, for iterations and *console.log()* function. e.g. *['Hello ', 'World!', 'Hello', 'Universe!'];*
4. Open a terminal window by clicking the terminal-icon at the left lower rim of Webstorm.
5. Install all missing JS packages, that Webstorm requires from you.
6. Start your server by using the node command, e.g. *node myServer.js*
7. If everything is correct, you will see the helloWorld statement as a output from your server in the bottom terminal window of Webstorm.
