Introduction

Vue directives are special tokens in *Vue.js* that extend the functionality of HTML by providing dynamic behavior to DOM elements. They are prefixed with *v-* and are used to bind data, manipulate DOM attributes, or listen to events. Common directives include *v-bind* for binding attributes, *v-if* for conditional rendering, and *v-for* for looping over data. By leveraging directives, developers can create highly interactive and reactive user interfaces with minimal effort.
