

LU01a - Creating a component

Define the function

With `function Product() { }` you define a JavaScript function with the name Product. This is also going to be our components name

```
function Product() {
```

```
}
```

```
<code>
```

```
===== Return markup =====
```

Every component has to `return` a value. We create a `<color #00008B>return()</color>` with JSX Markup. This is a special Markup Language made for React to write HTML alike in JS.

```
<code>
```

```
function Product() {
```

```
  return (
```

```
    <div>
```

```
      
```

```
    </div>
```

```
  );
```

```
}
```
