

LU03.L01 - Choose data-types

Task a) Choose datatypes

Which datatype would you use to store the following information? Give reason for your decision.

- product-title like trousers up to 50 characters:
 - **VARCHAR(50)**
 - Titles can be at the most 50 characters. A fix length makes not sense in that case.
- product-description up to 255 characters:
 - **VARCHAR(255)**
 - The description can be 255 characters, but can also be shorter. A fix length does not make sense in that case.
- stock amount:
 - **INT or INTEGER**
 - Floating point type is not suitable as pieces are always counted in whole numbers.
- price of each piece:
 - **FLOAT(5,2) or DECIMAL(U5,2)**
 - Prices have floating point
 - The length of (5,2) should be sufficient enough as trousers are usually within a price ranger of 0.99 to 999.99.
- order date:
 - **DATE or DATETIME**
 - The type depends on whether we want to safe only the date, but also the time.
 - Usually in such cases to store only the order-date is enough.
- date of delivery:
 - **DATETIME or TIMESTAMP**
 - Regarding delivery quality the criteria punctuality might be one key element. Therefore the storage of the delivery-time is compulsory.

* whether organical or not:

- **BOOLEAN**
- As there a only two possibilites to store a boolean data-type is the correct data-type.
- usage category with only one character:
 - As long as there is only one character to be stored the CHAR-type will work.
 - Technically the CHAR-types allows all letters, digits (as letters) and special characters.
