

# LU03a - Concept of a RDB

A Relational Database (RDB) is a structured method for storing and organizing data. The core idea is to represent data as related tables.

## Key components

- **Tables:** A collection of related data organized into rows (records) and columns (fields). Each row represents a unique entity, and columns contain specific attributes.
- **Records:** A single row in a table, representing a specific instance of data.
- **Fields:** A column in a table, defining the type of data stored in each row.
- **Relationships:** Connections between tables based on shared data. Common types include one-to-one, one-to-many, and many-to-many relationships.

## Structure and Integrity

- **Primary Key:** A unique identifier for each record in a table.
- **Foreign Key:** A field in one table that references the primary key in another table, establishing a relationship.
- **Data Integrity:** Ensures data accuracy and consistency through constraints like:
  - Entity Integrity: Every table must have a primary key with no null values.
  - Referential Integrity: Foreign key values must match existing primary key values or be null.
  - Domain Integrity: Data values must conform to defined data types.

## Advantages of RDBs

- **Data Consistency:** Enforced by relationships and constraints.
- **Data Security:** Access control mechanisms protect sensitive information.
- **Data Independence:** Changes to data structure can be made without affecting applications.
- **Efficient Data Access:** Indexing and query optimization enhance performance.

## Common RDB Systems

- MySQL
- PostgreSQL
- Oracle Database
- Microsoft SQL Server

## Vocabulary

| English         | German                                |
|-----------------|---------------------------------------|
| row             | Zeile                                 |
| column          | Spalte                                |
| entity          | Objekt(-Einheit)                      |
| attribute       | Eigenschaft                           |
| instance        | Exemplar, Beispiel                    |
| unique          | einzig(-artig)                        |
| to reference to | verweisen auf                         |
| to establish    | errichten, herstellen                 |
| consistency     | Widerspruchsfreiheit, Übereinstimmung |
| constraint      |                                       |
